Understanding RSV

- Respiratory (“res-per-uh-taw-ree”) syncytial (“sin-sish-uhl”) virus, also called RSV, is a **contagious cold-like virus** that infects the airways and lungs
- All children are at risk of RSV infection; however, **severe infection is more likely in very young babies**, especially younger than 6 months, than in older children
- RSV infection is one of the **most common reasons for hospitalization** among very young babies

Local doctors and researchers are participating in the GRACE Clinical Study.

Consider Joining Us in the GRACE Clinical Study

The goal of the GRACE Clinical Study is to learn more about a study vaccine, including whether it may help **boost the level of RSV-fighting antibodies** in pregnant women and whether those antibodies pass to their babies.

What we learn in this study may possibly help us develop an **RSV maternal vaccine in the future.**

Learn More and See if You May Qualify

The GRACE Clinical Study is looking to enroll healthy women aged 18 to 49 years who are in their **second or third trimester** of pregnancy (between about 24 and 34 weeks of gestation).

To learn more about taking part in the GRACE Clinical Study, please contact the study team. **Feel free to discuss this information with your doctor and your family** and ask the study team any questions you may have.
